

- Note that the hexadecimal values in the pan column are not what might be expected as these are the actual values that are used on the communications line from the Burle equipment. In the Burle protocol, the bit positions of the pan speed cross over a nibble boundary and are thus a pain to read. (Works just fine with the software and hardware, but is difficult for the human-ware. And of course tilt is nicely aligned on a nibble boundary.)
- In the following table, most entries are not used by the TXB-B. I have marked those that are used in **bold** type. The last column (marked “Fixed Speed ON 1x Cmnd”) indicates the command used with fixed speed keyboards to select a given set of pan/-tilt speeds. The default speed is given by ON 15 which marked in **bold**.

Table Index	Pan			Tilt			Fixed Speed ON 1x Cmnd

1.7.4 Q: Wow! Looking over that table it seems that the AutoDome moves faster than the Spectra does until you get to turbo speed. Are you sure that your numbers are correct?

A: I'm sure and Burle does not have the Spectra's low speeds. (Unless we have a "high speed" model and others have a "low speed" model.)

1.7.5 Q: How do I change the pan/tilt speeds that are available to me on a fixed speed system?

A: Use the following "ON" commands to get the indicated speeds. (In an Esprit the speeds will differ and in future versions of the Spectra they may also differ. In future revisions of the equipment, the speed available with the TXB-B may change. Be sure to use the manual that came with your unit.)

20°/Sec (ON 15) is the default value.

Command	Speed °/Sec	Command	Speed °/Sec
ON 11	3.8	ON 15	20
ON 12	6	ON 16	29
ON 13	9.6	ON 17	46
ON 14	15.2	ON 18	60.1

1.7.6 Q: With my Burle cameras the zoom speed changes depending on how hard I twist the joy stick. The Spectra does not do this, it seems to only have one speed for zoom. What is wrong?

A: None of Pelco's products have a dynamically variable zoom speed feature, so it wasn't implemented.
