A	S Record File Format	23

1 Format of Downloader files

Recently working with the downloader has indicated that there are multiple different file formats used in downloading various Pelco PTZ units.

The “typical” files that I have selected came from the Pelco Web site where that was possible. However on the Web Site there are no files for the ExSite or the Spectra III. (The Esprit is not a downloadable device.)

In the files that are listed below, the indicated files were run through HEAD and then TAIL to extract the first, and last, 10 lines from each file. Then the extracted data was run through MAXLL75 to limit each line to a maximum of 75 characters. When a continuation line was necessary it was preceded by three “dots” (...). Line lengths varied from a minimum of 46 bytes to a maximum of 142 bytes. These line lengths do not include the newline thing (which consists of a pair of characters of 0x0D and 0x0A) at the end of each line.

The download files for the ExSite came from an old development version and may not be correct. I couldn’t find a current version on the Pelco web site.

Things to note:

1. The S RECORD “data” lines are different between the Spectra IV and all other files. The data lines start with \$2 all of the others start with \$3.
2. In the S RECORD document shown in Appendix A, page 23 it suggests that files end in \$7 if the data records are \$3 and in \$8 if the data records are \$2. For the Spectra IV this is violated.
3. For the ExSite not all of the files end in any of the three recommended last record types of: \$7, \$8 or \$9.
4. What is **not** obvious is that no where in the download files is the \$5 record used.
5. The Spectra IV is the only set of files that has partially useful data in the \$0 record. All the other files have either HDR or nothing in them.

A S Record File Format

```

1      SREC(4)          UNIX 5.0 (03/21/84)          SREC(4)
2
3      NAME
4          srec - S-record file and record format
5
6      DESCRIPTION
7          An S-record file consists of a sequence of specially
8          formatted ASCII character strings. An S-record will be less
9          than or equal to 78 bytes in length.
10
11     The order of S-records within a file is of no significance
12     and no particular order may be assumed.
13
14     The general format of an S-record follows:
15
16     +-----//-----+-----+
17     | type | count | address |           data           | checksum |
18     +-----//-----+-----+
19
20     type      A char[2] field. These characters describe the
21             type of record (S0, S1, S2, S3, S5, S7, S8, or
22             S9).
23
24     count     A char[2] field. These characters when paired and
25             interpreted as a hexadecimal value, display the
26             count of remaining character pairs in the record.
27
28     address   A char[4,6, or 8] field. These characters grouped
29             and interpreted as a hexadecimal value, display
30             the address at which the data field is to be
31             loaded into memory. The length of the field
32             depends on the number of bytes necessary to hold
33             the address. A 2-byte address uses 4 characters,
34             a 3-byte address uses 6 characters, and a 4-byte
35             address uses 8 characters.
36
37     data      A char [0-64] field. These characters when paired
38             and interpreted as hexadecimal values represent
39             the memory loadable data or descriptive
40             information.
41
42     checksum  A char[2] field. These characters when paired and
43             interpreted as a hexadecimal value display the
44             least significant byte of the ones complement of
45             the sum of the byte values represented by the
46             pairs of characters making up the count, the

```

47 address, and the data fields.
48
49 Each record is terminated with a line feed. If any
50 additional or different record terminator(s) or delay
51 characters are needed during transmission to the target
52 system it is the responsibility of the transmitting program
53 to provide them.
54
55 S0 Record The type of record is 'S0' (0x5330). The address
56 field is unused and will be filled with zeros
57 (0x0000). The header information within the data
58 field is divided into the following subfields.
59
60 mname is char[20] and is the
61 module name.
62
63 ver is char[2] and is the
64 version number.
65
66 rev is char[2] and is the
67 revision number.
68
69 description is char[0-36] and is a
70 text comment.
71
72 Each of the subfields is composed of ASCII bytes
73 whose associated characters, when paired,
74 represent one byte hexadecimal values in the case
75 of the version and revision numbers, or represent
76 the hexadecimal values of the ASCII characters
77 comprising the module name and description.
78
79 S1 Record The type of record field is 'S1' (0x5331). The
80 address field is intrepreted as a 2-byte address.
81 The data field is composed of memory loadable
82 data.
83
84 S2 Record The type of record field is 'S2' (0x5332). The
85 address field is intrepreted as a 3-byte address.
86 The data field is composed of memory loadable
87 data.
88
89 S3 Record The type of record field is 'S3' (0x5333). The
90 address field is intrepreted as a 4-byte address.
91 The data field is composed of memory loadable
92 data.
93
94 S5 Record The type of record field is 'S5' (0x5335). The

95 address field is intrepreted as a 2-byte value
 96 and contains the count of S1, S2, and S3 records
 97 previously transmitted. There is no data field.
 98
 99 S7 Record The type of record field is 'S7' (0x5337). The
 100 address field contains the starting execution
 101 address and is intrepreted as 4-byte address.
 102 There is no data field.
 103
 104 S8 Record The type of record field is 'S8' (0x5338). The
 105 address field contains the starting execution
 106 address and is intrepreted as 3-byte address.
 107 There is no data field.
 108
 109 S9 Record The type of record field is 'S9' (0x5339). The
 110 address field contains the starting execution
 111 address and is intrepreted as 2-byte address.
 112 There is no data field.
 113

114 EXAMPLE

115 Shown below is a typical S-record format file.

116
 117 S00600004844521B
 118 S1130000285F245F2212226A000424290008237C2A
 119 S11300100002000800082629001853812341001813
 120 S113002041E900084E42234300182342000824A952
 121 S107003000144ED492
 122 S5030004F8
 123 S9030000FC
 124

125 The file consists of one S0 record, four S1 records, one S5
 126 record and an S9 record.
 127

128 The S0 record is comprised as follows:
 129

130 S0 S-record type S0, indicating it is a header
 131 record.
 132
 133 06 Hexadecimal 06 (decimal 6), indicating that six
 134 character pairs (or ASCII bytes) follow.
 135
 136 00 00 Four character 2-byte address field, zeroes in
 137 this example.
 138
 139 48 ASCII H, D, and R - "HDR".
 140
 141 1B The checksum.
 142

143 The first S1 record is comprised as follows:

144

145 S1 S-record type S1, indicating it is a data record
146 to be loaded at a 2-byte address.

147

148 13 Hexadecimal 13 (decimal 19), indicating that
149 nineteen character pairs, representing a 2 byte
150 address, 16 bytes of binary data, and a 1 byte
151 checksum, follow.

152

153 00 00 Four character 2-byte address field; hexadecimal
154 address 0x0000, where the data which follows is to
155 be loaded.

156

157 28 5F 24 5F 22 12 22 6A 00 04 24 29 00 08 23 7C Sixteen
158 character pairs representing the actual binary
159 data.

160

161 2A The checksum.

162

163 The second and third S1 records each contain 0x13 (19)
164 character pairs and are ended with checksums of 13 and 52,
165 respectively. The fourth S1 record contains 07 character
166 pairs and has a checksum of 92.

167

168 The S5 record is comprised as follows:

169

170 S5 S-record type S5, indicating it is a count record
171 indicating the number of S1 records.

172

173 03 Hexadecimal 03 (decimal 3), indicating that three
174 character pairs follow.

175

176 00 04 Hexadecimal 0004 (decimal 4), indicating that
177 there are four data records previous to this
178 record.

179

180 F8 The checksum.

181

182 The S9 record is comprised as follows:

183

184 S9 S-record type S9, indicating it is a termination
185 record.

186

187 03 Hexadecimal 03 (decimal 3), indicating that three
188 character pairs follow.

189

190 00 00 The address field, hexadecimal 0 (decimal 0)

191 indicating the starting execution address.
192
193 FC The checksum.
194
195
196 (last mod. 8/15/84)
197
198 A note (or minor nit)-
199 This is the first time that *I* have ever seen the 78-byte limit on total
200 record length or 64-byte limit on data length. I wouldn't trust those
201 values.
202
203 Note also that the count field can have values in the range of 0x3-0xff
204 (2 bytes of address + 1 byte checksum = 3, a not very useful record), and
205 that this is the count of remaining character *PAIRS*, including
206 checksum.
207
208 Whenever I write code to convert S-Records, I always assume that a record
209 can be as long as 514(decimal) characters in length (255 * 2 = 510, plus
210 4 characters for the type and count fields), plus any terminating
211 character(s). That is, in establishing an input buffer in C, I would
212 declare it to be an array of 515 chars, and leave room for the
213 terminating null character.
214
215 That should cover it :-)
216
217 The above was keyed in by and a tip of the hat to:
